

PEDALSHIELD

Ride private. Earn shielded.

30-Day Launch Sprint & Zcash-Community Investor Plan

For zodlers — the ZEC-aligned backers who win when Zcash grows.

The thesis: Pedalshield turns everyday bike rides into recurring shielded ZEC payments. Every rider is new demand for Zcash. Back the demand engine, grow the asset you already hold.

Live now: pedalshield.app · Autonomous shielded payouts proven on mainnet · Open source (MIT)
IntelliGrip Industries · June 2026 · ZecHub Hackathon 2026 (Games)

1. The opportunity

Zcash has the strongest privacy technology in crypto and a committed holder base — but its growth question is **demand: who is actually making shielded payments, and why?** Pedalshield answers that. It is a privacy-first bike-to-earn app: riders track real rides, the phone verifies them on-device (the route never leaves the phone), and an autonomous backend pays real shielded ZEC on mainnet. **Every paid ride is a shielded transaction that would not otherwise exist.**

This is not a whitepaper. The hardest part is already built and proven: a hand-rolled, fully autonomous Orchard spend pipeline running under current (NU6.2) consensus, with real mainnet txids. The consumer front door is live at pedalshield.app with an open waitlist.

2. Why back this if you hold ZEC

Zodlers are uniquely positioned to win from Pedalshield because the returns are **both strategic and financial**:

- **It grows the asset you hold.** More riders → more recurring shielded transactions → more demonstrated, real-world utility for ZEC. Utility is what a privacy coin most needs to defend and grow its value.
- **It is natively Zcash.** No token, no bridge, no other chain. Rewards are direct shielded ZEC. Pedalshield only works because Zcash exists — its success is Zcash's success.
- **It closes a flywheel only Zcash can close. Mining funds riding → riding creates shielded demand → demand supports ZEC → stronger ZEC funds more mining and more riding.** Miners supply infrastructure, custody, and ZEC; riders supply demand.

In short: a zodler who backs Pedalshield is buying equity in a company **and** investing in the utility of their own bag.

The single most valuable thing we do for Zcash: onboard ordinary, non-crypto people into **holding and using shielded ZEC**. Every rider gets a shielded address and a recurring reason to receive private payments — growing the shielded *user base*, not just transaction count. That is the adoption metric Zcash most needs and can least manufacture on its own. The open-source infrastructure (spend pipeline, FROST ceremony, hardware-attested ZK) and the miner flywheel exist to make that onboarding credible and fundable.

3. The 30-day launch sprint

Goal of the sprint: get the word out, drive free waitlist + beta signups, and open investor conversations with the Zcash community — fast, lean, and Zcash-native first.

Week	Moves	Target
Week 1	Finish & post the demo video (real ride → on-device verify → shielded	Demo video live; analytics on;

Week	Moves	Target
	payout). Wire site analytics. Write the Zcash Community Forum intro thread. Lock the open-source story (README receipts).	250+ waitlist
Week 2	Zcash-native launch: post in the Zcash Community Forum, the Zodi / Zashi community, r/zec, Zcash Global Discord (#hackathon), and ZecHub. Publish the X thread. Lock the ZecHub Hackathon submission.	Forum + Discord traction; 750+ waitlist; hackathon submitted
Week 3	Broaden beyond Zcash: Product Hunt prep, privacy + cycling subreddits and clubs, a referral hook (invite a rider). First gear-partner and sponsor-pool outreach.	1.5K+ waitlist; 1 sponsor convo; PH scheduled
Week 4	Convert + fund: open TestFlight/closed beta to the warmest waitlist segment; open the zodler backing round (deck + this plan); submit the Zcash Community Grants application; confirm a sponsor reward pool.	Beta cohort live; ZCG app in; first zodler commitments

Why Zcash-first: the warmest audience for a shielded-payout app is the privacy community, and it doubles as your investor pool. Every Strava privacy scandal is air cover; answer each one within 24 hours.

4. Free → paid: how it makes money

Free to download, always. The free app is a genuinely good private ride tracker that pays small shielded ZEC — that is the acquisition hook, not the business. Money comes from privacy-compatible lines (no data sales, no ads, no token — ever):

- **Premium subscription (primary) — \$4.99–7.99/mo:** on-device AI ride analytics, training insights, local route suggestions, higher earn caps. Strava charges \$11.99/mo and takes your data; we undercut and keep data on the phone.
- **Gear partnerships / redemption:** riders redeem ZEC or get member discounts with bike brands; Pedalshield takes affiliate margin. Brands get privacy-positive association, zero rider data.
- **Corporate wellness white-label:** employers pay per seat for verified-km programs; they see opted-in aggregate km, never routes.
- **Sponsor-funded reward pools:** a brand funds “commuter month”; sponsors top up the treasury, not the founders.

The honest unit economics: payouts are small (0.0002 ZEC/km, capped 0.005 ZEC/ride). A 100K-rides/month reward pool is covered by roughly **~2,000 premium subscribers**. Rewards are a customer-acquisition cost; subscriptions and sponsors are the business. (All ZEC figures parameterized; rates are env knobs repriced without redeploys.)

5. The path to funding miners, electricity, and a full-time node/oracle

Here is the part that matters to you, told straight: **the app loses money before it makes money**. Rewards go out before subscriptions and sponsors come in. So infrastructure is funded in three phases, with a bridge up front and surplus taking over later:

Phase	What's happening	Who pays for infrastructure
A • Months 0–6	Launch, beta, retention focus. App is reward-negative. Premium not yet at scale.	Bridge: ZCG grant + sponsor pools + lean bootstrap + zodler pre-seed. Stand up a part-time node/oracle.
B • Months 6–12	Premium tier ships; sponsors recurring; retention proven (D30 ≥ 20%).	Revenue approaches and covers reward burn → operating break-even. Node/oracle goes full-time.
C • Month 12+	Subscriber + sponsor surplus; miner-recruitment flywheel active.	App surplus + miner partners fund ZEC miners, facility fees, and electricity. “Mining funds riding” closes.

Miners are not just a cost line — they are a **growth partner class**. Zcash miners already hold ZEC, run 24/7 infrastructure, and want protocol-aligned utility as block rewards taper. Pedalshield gives them roles (run settlement nodes, co-steward the treasury, fund reward pools) — turning the chain's security base into Pedalshield's supply side.

Honest note: specific miner hardware, facility, and electricity figures depend on live hardware and energy quotes and are not promised here. The plan funds infrastructure in the sequence above — bridge first, surplus second — not from app revenue on day one.

6. The funding stack (your “mix of all three”)

Source	What it funds / why it fits	Status / timing
Zcash Community Grants (ZCG)	Public-good, open-source ecosystem work — exactly our hand-rolled spend pipeline, the public FROST treasury ceremony, and ZK proof-of-distance R&D. Funded by 8% of mining rewards through the 2028 halving; rolling applications.	Apply Week 4. Non-dilutive.
Zodler / community backing	A defined angel/pre-seed from ZEC-aligned backers. Equity/SAFE — no token, no yield promises. Funds team, treasury seeding, growth, and infra bridge.	Open Week 4. Dilutive (SAFE).
Sponsor reward pools	Brands fund themed reward pools (“commuter month”). Offsets reward burn directly; privacy-positive brand association.	Outreach Weeks 3–4. Non-dilutive.
Seed round (optional)	The ~\$1.5–2.5M institutional round from the scale plan — kept optional, raised against retention + revenue, never token mechanics.	Later, if metrics warrant.

Plus: the ZecHub Hackathon 2026 (Games track) — credibility and prize potential, submission this sprint.

7. The specific ask (for zodlers)

We are opening a **community pre-seed of \$250K** (range \$150K–\$400K) via SAFE, aimed at ZEC-aligned backers. Illustrative use of funds:

Use of funds	Share	≈ at \$250K
Team (lean: mobile, protocol/Rust, growth) for ~9–12 mo	40%	\$100K
Treasury seeding (rider rewards, parameterized)	20%	\$50K
Infrastructure: full-time node/oracle, settlement workers, first mining/co-location step	25%	\$62.5K
Growth: launch, beta, referral incentives, gear/sponsor BD	15%	\$37.5K

What backers get: equity exposure (SAFE) to a flagship Zcash consumer app, plus the strategic upside of growing ZEC utility. **What we will not offer:** a token, a yield, or any promise of dollar returns. Privacy is the product, not yield.

Milestones you can hold us to: ZCG application submitted (30 days); beta live with D30 retention $\geq$ 20% (90 days); premium tier + first sponsor pool and a full-time node/oracle (12 months).

Disclaimer: This document is information, not investment advice or an offer to sell securities. Figures are illustrative and forward-looking. Any raise will be conducted with qualified legal counsel and applicable securities/KYC compliance.

8. Milestones & KPIs

Horizon	Targets
30 days	Demo video live; 1.5K+ waitlist; hackathon submitted; ZCG application in; beta cohort opened; first zodler commitments.
90 days	Closed beta in one metro; D30 retention $\geq 20\%$; fraud-rejection telemetry healthy; first sponsor pool live; part-time node/oracle running.
12 months	Premium tier shipped; revenue trending to cover reward burn; full-time node/oracle; first miner partner(s); ZK proof-of-distance R&D underway.

Core KPIs: waitlist → beta conversion, D30/D90 retention, rides/rider/mo, premium conversion, reward-burn-vs-revenue ratio, fraud rejection rate, and node/oracle uptime.

9. Risks & mitigations

- **ZEC volatility** (reward liability is ZEC-denominated): tight caps, dynamic per-km repricing, fiat sponsor pools.
- **Zcash platform churn** (Orchard→Ironwood proved spend paths can be deprecated): SDK-free hand-rolled pipeline; budget one consensus rewrite/year.
- **Fraud / Sybil:** layered on-device anti-cheat today (honest about limits); hardware attestation via the edge node next (integrity — proves real, untampered hardware); ZK later for trustless verifiability, not as the anti-cheat itself.
- **Regulatory:** paying ZEC for activity is cleaner than a token; monitor money-transmission angles per jurisdiction; privacy-first design is a GDPR asset; counsel engaged for the raise.

10. The close

Pedalshield is already on mainnet and already on the web at pedalshield.app. The 30-day sprint turns that into momentum; the funding stack turns momentum into the infrastructure — miners, node, oracle — that makes the whole thing self-sustaining. For a zodler, this is the rare chance to back a company **and** the utility of your own ZEC at the same time.

Back the demand engine for Zcash. pedalshield.app
